Dear Editor,

I read the manuscript titled " Investigation of the effects of wet cupping therapy on some inflammatory factors in patients affected by non-alcoholic fatty liver disease (NAFLD): A quasi-experimental trial study with self-controls ", and there are several points, which are:

1. The sample size in this research is so small and it affects the results.
2. The methodology is not clear and needs further explanation.
3. In discussion section fatty liver disease or its pathophysiology should be explained from the perspective of complementary medicine.
