The subject is interesting to study and evaluate the different environmental and individual factors associated with the *G. lamblia* infection. We find many aspects of the transmission risk, all associated with poor hygiene.

Methodology is clear and well described.

Results were also interesting but not well formulated. We had to return to the tables each time to see which aspect of the studied factor is associated with the high prevalence of the parasite. I invite the authors to clarify this point from the introduction to the conclusion.

Some sentences in the discussion are incomplete or not clear. Authors will find my propositions in the PDF associated with the email. What we do not see in the paper is if the other authors (cited in the paper) studied the same factors or not.

I invite the authors also to delete all % for sums under 25 (for example, when they speak about water sources, they wrote 4(50%) and it is not permitted).

The paper should be improved to be accepted.
