The article seems interesting to me. However, it should be improved in the following aspects:

- Title is too long. Try to make it short.
- The abstract should be improved. Please add particular emphasis on providing a clearer focus on the results. Provide correct results of antioxidant and anti-inflammatory assays in the abstract.
- Data of Figure 1 should be replaced with a Table.
- Please provide IC₅₀ values of the DPPH radical scavenging assay. You can follow this article (<https://doi.org/10.1016/j.focha.2023.100565>).
- GC-MS data should be added.
- In general, I find that the overall writing of the paper is acceptable; however, in some cases, it requires an additional review to improve the quality of English, including some grammar errors, word selection, sentence fragments, run-ons, sentence constructions, and style. Requested to proofread the manuscript by professionals.
