Fibrofolliculoma

National Cancer Institute

Source

National Cancer Institute. *Fibrofolliculoma*. NCI Thesaurus. Code C43331.

A rare, pilar-associated mesenchyme neoplasm with follicular differentiation. It usually occurs in the face, neck, and chest. It presents as a dome-shaped papular lesion. It is composed of epithelial and mesenchymal cells. Patients with Birt-Hogg-Dube syndrome may develop follicular fibromas.
