**Potential competing interests:** No potential competing interests to declare.

I find the work interesting and useful, and may be of interest to scientists and technicians working on soil and changes of land use. The work falls within the scope of "Qeios". It has a sufficient impact and it represents an advance in the subject matter.

I think that the content of the manuscript is scientifically correct, with a good bibliographic review, an adequate methodology, good results and discussion, and the conclusions are clear and respond to the previously stated aims.

The content is quite good and I will only point out some errors of form.

I suggest the following changes:

- 1) All scientific names should be well written, in italics, and with the initial letter of the genus name capitalized. There are many misspelled scientific names.
- 2) Section "Methods and Material" should be renamed "Material and Methods".
- 3) Change "Euqlyptus" to "Eucalyptus".
- 4) Some words should not be capitalized: "Porosity", "Bulk density", etc.
- 5) Replace "&" with "and" in the text.
- 6) Change the symbol for ton (tn) to the correct symbol (t).
- 7) Put the references in the format of the publication standards of the journal.

For all the comments, I consider that the paper can be published in "Qeios" with minor changes.

I will be happy to review an improved version of the paper, if necessary.
