Potential competing interests: No potential competing interests to declare.

The article on "Maths Fear: Reasons and Steps to Reduce" attempts to tackle an important issue. This work has some results, but these results are not analyzed well. I suggest proper analysis of the data is very much required, and make sure to provide statistical analysis accordingly.

A more rigorous examination of studies or expert opinions would enhance the article's credibility. Introducing more **relatable anecdotes or real-world examples** could help make the content more compelling and relatable.

One more thing I would like to suggest here is that all relevant literature references should be cited properly.

With these few minor adjustments, this article has the potential to become an even more influential guide in addressing the widespread issue of maths fear.
