The article was not new and interesting to me. As I was reading it, I thought at one point that I was reading a Cloud Computing blog. The article lacks experimental results. They never mention where they test the proposed model. On the other hand, the proposed model is not interesting since it is something that is already known. They could have turned the article around by proposing infrastructure for the use of cloud computing and then suggesting which one is better and why in the educational field. To do this, they would have presented a case study where said technological infrastructure is tested.
