Review of: "The Pause That Protects? A New Framework for Autistic Regression and Strategies for Recovery"

Dario Siniscalco¹

1. University of Alabama at Birmingham, United States

Very interesting commentary explaining a theory.

Some of my questions are:

- How many autistic children showed "recovery" after regression, even if without any form of therapy and respecting a "pause"?
- I would avoid the examples of past persons (i.e., Einstein, ...) as the cases should be very detailed (i.e., diagnosis?) and not appropriate references could be given.
- How to assess metabolic status in clinical settings? Could you provide a brief explanation?
