Potential competing interests: No potential competing interests to declare.

This search tool is very useful for those engaged in research on CAM. It reduces the tediousness of mining through a mountain of data on this specific issue. It is note worthy that the tool performs at par/better than existing search engines.

A comparative table highlighting the superiority of this tool over the other available search tools would have been added more value to the tool. Similarly, user experience should have been included. Overall a very useful piece of work.
