The author is utilizing a microcontroller, specifically NodeMCU, along with related sensors to monitor a certain situation. The characteristics of the monitored data are displayed on the Thing.io dashboard, but it remains unclear how the user is alerted about any issues. As a suggestion, it could be beneficial to transmit a red signal indication to the user through an app, utilizing the sensor and Thing.io integration.

Additionally, it would be valuable to assess the efficiency of this system in comparison to the current existing system. Furthermore, it is important to address the gap between the literature survey and the proposed work, as it seems to be missing in the current context.
