Dear Authors, I carefully read and reviewed your case presentation. The title is clear, and the abstract is sufficient. The introduction is very well written and contains important general information. The presentation of this case report of a young male patient with rhabdomyolysis and acute kidney injury after a heavy military exercise is very successful. The quality, resolution, and content of the figures are adequate, and the tables are very detailed and important. The English is legible and easy to understand, and I did not find any spelling errors. The references conform to the journal format and are up to date. I found the table in which the patient's blood results are shared in detail day by day very successful. In addition, when evaluated in terms of the discussion part, good studies from the literature on rhabdomyolysis and acute kidney injury were utilized. Articles on genotype were also included. I believe that this study, which I characterize as a successful case presentation in general terms, is suitable for your journal. My decision is to accept it.
