TGFB2 wt Allele

National Cancer Institute

Source

Human TGFB2 wild-type allele is located within 3p22 and is approximately 88 kb in length. This allele, which encodes TGF-beta receptor type-2 protein, plays a role in transcriptional regulation and cellular proliferation control. Mutations in this gene have been associated with Marfan Syndrome, Loeys-Dietz Aortic Aneurysm Syndrome, and the development of various types of tumors.
