Potential competing interests: No potential competing interests to declare.

The study's title is very holistic and could cover several issues within the assessment and management of pain. However, the article's content is very brief in general and lacks several details that the reader could need. The methodology part needs to be improved and show some details. The data analysis could have been more precise, and improvements were required. The discussion part should have mentioned the weaknesses/obstacles of conducting the study. There were no further recommendations in the conclusion part.
