**Potential competing interests:** No potential competing interests to declare.

The systematic review on retinal vasculitis delves into a compelling subject, yet several concerns warrant attention.

The primary limitation of this systematic review lies in the restricted sample size of patients studied. Relying on case reports as the primary data source introduces a layer of complexity to the overall findings. Since case reports often capture unique or rare instances, the generalizability of the results may be compromised. This limitation calls for cautious interpretation and should be explicitly addressed in the discussion section.

Moreover, pertinent details regarding the workflow for including studies are absent. For instance, information on how many reviewers evaluated studies and the diagnostic criteria for COVID-19 cases is crucial. Addressing these aspects would enhance the transparency and reliability of the study's methodology, contributing to a more robust evaluation of the findings.
