Potential competing interests: No potential competing interests to declare.

The issue addressed in this review is relevant.

Figure 1 and 2 can have a better graphic design and the text from subtitles should be improved.

In phrase "The use of nanoparticle technology in protein delivery can be applied to the following: I extending the half-life of proteins with poor pharmacokinetic properties in vivo", the number "I" should be placed by "i").

In phrase "Exciting techniques include mucoadhesive polymers, microspheres, nanoparticles, nanoemulsion, and nanoemulsion", "nanoemulsion" is repeated.

Representative images of some of the nanocarriers could be added for a visual understanding of the subject. A small chapter of strategies for encapsulating the proteins in nanocarriers and strategies used to improved stability of nanocarriers can significantly enrich this review.

Overall, it is a good and relevant review.
