# Differentiated (Simplex) Penile Intraepithelial Neoplasia

National Cancer Institute

## Source

National Cancer Institute. *Differentiated (Simplex) Penile Intraepithelial Neoplasia*. NCI Thesaurus. Code C162539.

Intraepithelial neoplasia of the penis usually presenting as a solitary white or pink macule or plaque that may be slightly elevated. A background of long-standing lichen sclerosus is often present. It is characterized by a thickened epithelium, subtle abnormal cellular maturation, and atypical basal layer cells. Parakeratosis is common. (WHO 2016)
