Potential competing interests: No potential competing interests to declare.

The study is descriptive and informative of the current glycemic control of the patients in Limbe hospital and I suggest some addition that will increase the study validity and generalizability (major comments):

1-The method of sample size calculation.

2-The inclusion/ exclusion criteria need to be more specific (e.g. age, gender, co-morbidities,... etc)

3-A supplement that includes the study questionnaire should be added.

4-The duration of fasting before FPG should be added.

5-Reference 20 is not reflective of the ADA definition of glycemic control.

6-It would be recommended to add the other associated diseases in the baseline characteristics of the study population especially (HTN, CAD, Stroke, CKD)
