

Review of: "Adolescents' Knowledge of Sexuality in a School Context: A Descriptive Study"

Awirut Singkun

Potential competing interests: No potential competing interests to declare.

Abstract

- recheck and correct % of participants (see Table 1).
- I don't think the conclusion is appropriate for this study because this study did not evaluate the tools.
- Presenting each number, I think . (point) is better than , (comma).

Methods

- This study used previous tools of Carvalho; do you have details about validity, trialing, and reliability?
- Page 4, what is CSF (if it is correct, please provide its full word before abbreviation.)
- Page 4, the sample size was 358, but in the results it is 359.
- Table 1, sub-scales of education level and course should be moved.
- Table 2, the average of QACSES should not be presented twice in the same sentence.

Conclusion

- I think the sentence "although it has not shown the same association with changes in sexual behavior." is not appropriate here because it is a limitation of behavior studying. That, this sentence should be added to recommendations for further study.
