**Potential competing interests:** No potential competing interests to declare.

The topic is of interest. However, the article seems to be too short and does not include all the necessary components. More literature is needed in the discussion to compare the study to previous literature. The method is not informative enough for anyone to reproduce this experiment (e.g., what was the noise level in the high noise group?). There are other factors such as temperature and lighting at play in the method but do not seem to be mentioned in the result section. The results are too simplified as well. The method section mentions that student demographics were collected, but none were presented in the results section.
