Comments and suggestions on the manuscript that is entitled "A case study of the management information system in the coffee industry in SW Ethiopia"

## **Title part**

1. The research title somehow needs modification. The researcher should modify the title to "the effect of management information systems in the coffee industry in southwest Ethiopia."
2. Don't use abbreviations in the title part. E.g. SW

## **Abstract part**

1. In the abstract part, the first three lines are not important to include.
2. In the abstract part, the researcher doesn't show the major findings of the manuscript. The researcher should incorporate the major finding and recommendation in the abstract.
3. Some of the keywords are not relevant to include in the keywords part, like FMIS, web-based coffee, and IOT.

## **Introduction**

1. The research doesn't show the rationality of the manuscript in the introduction part, and the researcher also doesn't incorporate literature related to coffee farming.
2. The introduction part loses its coherence, and the researcher doesn't synthesize the literature in a smart way.
3. The main comments are about the references and literature review, which could do with a substantial rewrite. The current literature review does not seem comprehensive and is missing some of the contemporary studies related to MIS, especially in the coffee industry globally and specifically in Africa and Ethiopia.

## **Conclusion and recommendation**

1. I don't know why the researcher reached the conclusion and recommendation part without any data, analysis, or findings. No sense at all.
2. It is difficult to say whether such types of research are systematic literature reviews or meta-analyses. Generally, this article has no sense of its contents.

**Generally,** this article is not qualified to be published and should be rejected.
