The topic of the article is a good one, but there are a few ambiguities and a lack of information in the paper, and some details need to be addressed:

1. The introduction section of the paper lacks a comprehensive examination of the latest research progress, especially about nominal spatial precision obtained with GNSS & IMU sensors.
2. It is necessary to briefly present the characteristics of the position sensor and its influence in determining the flight routes during the experiment.
3. The references are required to add more modern approaches within the last few years.
