Potential competing interests: No potential competing interests to declare.

This paper provides a somewhat fair assessment of the content, but there are a few areas that need improvement. Firstly, it mentions that the comparison is based only on cloud computing usage, but it lacks clarity on what is being compared. Adding more context to this point would be helpful. Secondly, the reference being too old and not up to date is a valid concern; however, it would be more helpful to specify the reference or suggest alternative, more recent sources. The comment on too much theoretical discussion and related works needs elaboration to understand the specific issues or suggestions for improvement. Lastly, the positive aspect of the idea of cloud computing in education is acknowledged, but it could be beneficial to expand on why it's worth further research or how it could potentially impact the field. Overall, the comment provides some valuable feedback, but more specific and actionable suggestions would enhance its effectiveness.
