Potential competing interests: No potential competing interests to declare.

1. The section on denying the roles of humans in climate change should ideally be part of earlier arguments that suggest that firstly there is data manipulation/falsification by scientists and secondly that there are violations of scientific peer review principles in climate change research. This, in my opinion, also aligns with the argument advanced in the separate section about denying the role of humans in climate change.
2. Figures 1 and 2 were just dumped on the readers with vain reference in passing. One expects that the authors should make references to the data brandished in the two figures to further buttress the point being made.
