I found this article interesting and worth publishing. But would like to mention that analysing sustainable development from purely social perspective is not very productive. Especially in 2023, eight years after SDG6 global approval. For example, the last sentence of the conclusion: "New radical approaches to water are needed to reverse the sobering trends regarding water and to sustain support for life, development, and biodiversity for future generations and the future of humanity through intelligent and coordinated responses to these crises" , looks strange when many countries already report on the progress of such "radical approach" implementation. See SDG6.5.1 "Degree of integrated water resources management implementation (0-100)" at <https://www.unwater.org/our-work/integrated-monitoring-initiative-sdg-6/indicator-651-degree-integrated-water-resources> .
