Potential competing interests: No potential competing interests to declare.

The language and flow of ideas for this manuscript are poor. The methodology provided is insufficient to allow replicability, and therefore, the results presented are ambiguous. I suggest the authors refer to other peer-reviewed papers such as <https://doi.org/10.3390/atmos14050852> or <https://doi.org/10.1016/j.scs.2019.101428> to grasp a more thorough idea of the methodology to conduct a thermal comfort assessment. All the best.
