

Review of: "Comparison of Clinical and Radiological Diagnosis with Autopsy Findings in Fatal Traffic Accident Cases"

Gabriel Ogun¹

¹ Department of Pathology and Laboratory Medicine, Edward Francis Small Teaching Hospital, Banjul, Gambia

Potential competing interests: No potential competing interests to declare.

General Comments- A good attempt at the subject matter.

Abstract- Concise

Introduction- Fair

Methods- Clear and appropriate. This seems to be a retrospective study; please state this clearly in the methods section.

Results-

1. Age grouping of the patients was not expressly detailed and strongly considered in the results section. I suggest age groups in decades: 0-9, 10-19, 20-29, 30-39, etc.
2. In this section, the authors need to cut out the extensive use of writing and prose and let the figures and tables speak.
3. There is discussion of results under the results section. It is suggested that such should be removed.

Discussion- Fair (mention limitations of this study in relation to the retrospective nature)

References- Good.
