

Review of: "Additive and Multiplicative Operations on Set of Polygonal Numbers"

Fengwei Li

Potential competing interests: No potential competing interests to declare.

The goal of this paper is to produce k-gonal numbers. However, there are numerous grammatical mistakes in it. It doesn't add anything new to the body of literature. A large portion of the theory discussed in the paper seems to be easily found in already published works. In addition, the paper doesn't provide any new insights—it just solves equations and gives numbers.
