Potential competing interests: No potential competing interests to declare.

The authors deal with a potentially important health issue in rabbit production. However, several aspects of the article must be improved in order for it to be published.

For example, there is no data from quantitative results and the experimental design used is not specified. Furthermore, the authors do not take into account that data taken from the same animal at different times are probably correlated and requires an analysis with a mixed-effects model such as a repeated measures design. Even when the authors include two factors; time and treatment, they do not estimate the interaction effects.

Presenting the article only with graphs detracts the importance of the results.

Conclusion: given the aforesaid flaws in the study, the manuscript should be rejected.
