Dear Editor,

Overall improvisation is needed, research design, data collection, analysis, to result reporting, requires substantial improvement to enhance clarity .

Readability in the first sentence of the abstract.

The study suggests the use of the triangulation method for interviewing 37 farmers, but it lacks details regarding the sampling method and inclusion/exclusion criteria applied to select these farmers.

This study appears to be of a mixed-method exploratory nature; however, it would be helpful to clarify if ethical clearance and consent procedures were followed.

For the section on the triangulation method, please provide a more comprehensive explanation of the procedures, including the specific qualitative questions asked. Additionally, consider providing detailed participant narratives enclosed within double quotation marks.

Regarding observations, clarify the methodology used and whether experts assisted in data collection. Specify type of observation if various data types like video, photos, or audio were used, and include information on weather conditions during observation days.

Providing the survey questionnaire could also be beneficial.

In the section discussing quantitative methods, elaborate on the data collection process. Mention the type of descriptive statistics employed and whether any categorization or thematic analysis was performed.

Explain how the triangulation method contributed to data analysis and if any software tools were used.

It is advisable to separate the result and discussion sections for better organization. Further details can be included based on observations and qualitative data.
