Review of Prevalence of Anemia with Associated Socioeconomic and Demographic Factors in Nigeria

1. Under the introduction part, as your study area is Nigeria, what about other countries or continents? Rewrite it from specific to global, or from global to specific, addressing the prevalence of anemia and its associated factors as it is used for discussion and comparison.

2. And also under the introduction with your study area, you already know the association between socioeconomic and demographic factors with the prevalence of anemia. So, why do you need to do this study?

3. Under methodology, you should rewrite "independently."

    - Variables as independent and dependent variables

    - Operational definition of your work

    - Data quality control

    - Data collection tool

4. In binary logistic regression, as you put p-value = 0.05, this is to check which variable goes into multivariate regression. So, we cannot say there is a significant association under binary; rather, we say the result of multivariate regression with p-value = 0.005.

5. What is your discussion part with justification?

6. What are the strengths and limitations of the study?
