Potential competing interests: No potential competing interests to declare.

I believe that the manuscript is well-structured, but there are some areas where improvements could be made to strengthen the work.

Firstly, it would be beneficial to provide more detailed information about the findings and applications in the conclusion of the abstract.

The abstract can include a focus on highlighting the applications of the developed tools and codes.

Additionally, I recommend providing a background of the research and examples of previous applications to emphasize the novelty of the proposed tools. It is important to justify the rationale for selecting the indicators in each method to aid in the practical aspects of the methods.

To supplement Table 1, a further explanation regarding the term "Environmental issues" should be provided.

It would be useful to describe the ability to export results for all tools, as this is a highly valuable feature.

In the conclusion section, it is essential to mention any limitations of the research.

Furthermore, possible paths for developing tools and using more precise and practical indicators in the future should also be discussed.

Considering the suggestions of other reviewers can enhance the scientific value of the work and strengthen its practical aspects.
