The manuscript is considered good, and it deserves the quality to publish. However, it seems to me that some necessary corrections are highly required within the manuscript before the final acceptance. The following corrections are recommended within the manuscript:

1. The manuscript should be overviewed thoroughly to check out all grammatical errors in the sentences. Most of the sentences within all texts of the manuscripts did not reflect standard scientific English. The reviewer also recommends to recheck sentences in the abstract and conclusion sections.
2. The authors should replace the word "ND" with appropriate word or meaning in the discussion as well as in other sections of the manuscript. The word "ND" should not be used as data range.
3. Did the authors get chances to measure arsenic concentrations (As) in the water samples?
4. Did the authors get chances to assess EDI (Estimated Daily Intake of metals by adult and children) from the consumption of metal contaminated waterbodies?
5. The reviewer recommends to include a table by listing all operating conditions of AAS for each of the metals studied and add the detection limits of the respective metals.
