Summary

The author presents a review on current practices and future fields of action of e-learning and the application of AI. The article follows a classical structure.

I believe that this article addresses a current and important topic in educational science.

However, besides central information, there is a lack of evidence at the relevant text passages, so the article remains at the level of assertions. Thus, the article does not correspond to scientific standards. My major issues are listed below.

Major issues

- Important details about the methodological approach are missing (e.g., is the data corpus restricted to empirical studies?).
- It is unclear how the author arrives at her results and conclusions.
- There is no information about the sample size.
