The article as a whole exhibits a commendable level of writing proficiency, and I express my gratitude to the author for their efforts in this regard. However, I have identified some aspects that raise concerns. The use of pumps has significant importance within soilless\aquaponics cultivation systems. While you have already discussed this topic, it is imperative to further address the specific oxygen requirements for pumping relative to the volume of water. There is no explicit mention of the specific nutrients that are created for plants under this system. No specific information is provided regarding the kind of plants that can thrive in this particular setup. Due to the absence of controlled nutrient delivery, aquaponics lacks the ability to regulate nutrient levels. I would recommend that the author conduct further brief look into this matter, and as a result, I propose a minor revision.
