Meesmann corneal dystrophy

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base*. [Meesmann corneal dystrophy](#). ORPHA:98954

Meesmann corneal dystrophy (MECD) is a rare form of superficial corneal dystrophy characterized by distinct tiny bubble-like, round-to-oval punctate bilateral opacities in the central corneal epithelium, and to a lesser extent in the peripheral cornea, with little impact on vision.
