Potential competing interests: No potential competing interests to declare.

The work presented is commendable and has the potential for publication. However, there is a noticeable misalignment between the stated objective and the title of the manuscript. The primary aim of the study appears to be an assessment of Long COVID-19 and its associated factors. In contrast, the authors have focused their research on evaluating the effect of COVID-19 vaccination on Long COVID-19. This discrepancy could lead to confusion among readers regarding the study's intent and scope.

To ensure clarity and accuracy, it is recommended that the title be revised to better reflect the true aim of the research. A more appropriate title would be "Long COVID-19 and Associated Factors in Pakistan." This title succinctly conveys the study's focus on Long COVID-19 and its related factors, aligning with the research's overarching objective. .
