

# Peer-Reviewed Publishing

Miguel Abambres

Peer-reviewed publishing is a quite flawed process (in many ways) that has greatly harmed Science for a long time – it has been imposed by most academic and science funding institutions as the only way to assess scientific performance. Unfortunately, most academics still follow that path, even though I believe most do it for the fear of losing their job or not being promoted.

The eprint "Bye Bye Peer-Reviewed Publishing" <sup>[1]</sup> aims to encourage (i) a full disruption of peer-reviewed publishing and (ii) the use of free eprint repositories for a sustainable academic/scientific publishing, i.e. healthier (no stress/distress associated to the peer review stage and the long waiting for publication) and more economic, effective and efficient (research is made immediately available and trackable/citable to anyone).
