Potential competing interests: No potential competing interests to declare.

This is a very important paper because of the fact that the Tana Lake plays a crucial role in water management of Ethiopia. It is better if you included data availability statements in your manuscript. It will increase the acceptability of the study.

But I have some questions regarding the methodology used in the manuscript

1. The study considers only temperature and precipitation as major factors that affect the water level of lake Tana basin. However, what about other factors such as solar radiation and wind speed?
2. The study does not clearly show the nature the data used for the experimentation like either gauged or satellite data?
