Potential competing interests: No potential competing interests to declare.

Objectives were clear enough and a nice research concept.

But I'd suggest:

1. That the paper should present the values recorded by the instrument used in the noise level measurements, and, relatively, the values that were utilized in producing the charts in figures 2, 3, 4.
2. The ANOVA table should be shown too.
3. Results and discussion of this paper won't be complete until a comprehensive questionnaire is administered to the students/workers in the institutions assessed.
4. Heading "2" should be edited from "The problematic" to a well-constructed phrase.
