

Review of: "Larache's Coastal in Morocco: Evaluating Dredging's Impact on Fisheries and Shorelineevolution"

Katelene Da Cruz Delgado

Potential competing interests: No potential competing interests to declare.

First of all, the article topic was well presented. The coastal line and biological impact of dredging on the analyses in the introduction are clear and well presented.

Under the description of the study area, can you elaborate more on the species list present in the area, not just the ones with commercial value that can be found in the area, as well as analyse the fish stock and biomass evolution during time?

In addition, can you explore more of the impacts on the fisheries? For example, if there is data on the dredging, maybe you could match it with the landed fish variation in quantity that you have on table 3.

Also, could you elaborate more on the dredging consequences on the fish habitat, nursery zones, reproduction, and survival of fish larvae?
