Recombinant Interferon-alpha Inducible Protein 10

National Cancer Institute

Source

National Cancer Institute. *Recombinant Interferon-alpha Inducible Protein 10*. NCI Thesaurus. Code C1664.

A recombinant agent, chemically identical or similar to the endogenous small inducible cytokine B10 (IP-10). Interferon-alpha inducible protein 10 is secreted from macrophages, endothelial cells, and keratinocytes in response to stimulation of IFN-gamma. This agent is a potent inhibitor of angiogenesis, bone marrow colony formation, and is a chemoattractant for monocytes and T-cells, promotes T-cell adhesion to endothelial cells, and probably participates in chronic cell-mediated inflammatory reactions.
