Potential competing interests: No potential competing interests to declare.

Evaluation of the environmental and health risks of copper foil manufacturing plants is very important for human beings. However, the content described in this article is almost unrelated to the title. It is recommended to modify the title. Some other issues are as follows:

1. There is no data, table, or figure in this manuscript, and it doesn't look like an academic paper, but rather like a reading report.
2. Basically, the discussion of each part is too broad and not in-depth.
3. There is no in-depth discussion of the pollution process and mechanism of copper, especially the pollution of air, water, soil, and the human body. I suggest the author adjust the logical order and delve deeper into the above issues.
4. There are also some errors in the text, for example, "thera" should be "there" on Page 2. It is also recommended to strengthen the grammar of English.
