Potential competing interests: No potential competing interests to declare.

The English language of the MS must be checked. The introduction part is more or less OK, but at the end, the objective of the MS must be clearly noted.

The "Methodology" must be in detail, and the word "1st author...." is not required here.

The study is not in detail as a scientific paper must be, and it's just a small overview like a news article.

I would recommend to include information that is focused on the antimicrobial aspect (as your title is on the antimicrobial...), its doses, average concentrations, lethal doses, etc. You must also explain if any reactions that these superfoods could generate in the human body if taken in higher concentrations/amount. More information is necessary.

I think that before accepting the paper, the authors must work on these items, or else the catchy title of the MS is not suitable for the paper and it's misleading to the reader's perspective.
