Sentiment analysis is a field of natural language processing (NLP) that deals with analyzing and categorizing emotions and opinions expressed in written text. It aims to identify the writer's attitude towards a particular topic or product, and it can be performed on various forms of text data, such as reviews, social media posts, and news articles.

Starting with the abstract, the structure is not respected; here are the five fundamental components that need to be in every scientific abstract, Background, Objectives, Approach, Results and conclusion, which are absent in this article, we can hardly notice the background and the problem.

The work is devoid of the essential elements of a scientific paper, as we can notice it lacks the method, results, experimentation and even a clearly defined problem, here are the major points that need to be revised:

- Contribution is not well shown,
- The proposed work is not compared to existing approaches,
- The paper structure disorganized,
- The absence of clear definition of the problem,
- Grammatical mistakes,
- The literature review only consisted of a few references.

To sum up, there is a lot of work that needs to be done on this article.
