Bibliometric analysis and current status of Leishmaniasis research indexed in Scopus, 2010-2023

The paper was carefully done, and it is excellent updated material.

From my point of view, in the discussion section, the findings that "Mapping of performance of authors and organizations indicates that North American and European countries are leading research in leishmaniasis despite having a low burden of the diseases" and the statement " The study calls for increased north-south collaboration in order to effectively prevent and control the disease in endemic regions" probably this recommendation or thought is a goodwill wish. Data retrieved for this excellent work can be analyzed on a historical and economic basis.

In conclusion, this paper is excellent conceptually and methodologically.
