Review of: "Artificial intelligence in the service of health and safety at work: Perspectives and challenges from now to 2035 - A prospective study"

Steven A. Freeman[1]

1 Iowa State University

This manuscript addresses an emerging area of occupational safety and health. The are multiple ways that the authors could have approached this work. The methodology chosen was well explained and appropriate this type of prospective study. The authors have provided a structure for thinking about how AI may impact occupational safety and health practices. There is a lot to consider, but the presentation is reader friendly. This paper should be a conversation starter for researchers (and policy makers) as we begin to grapple with further integration of AI into occupational safety health. The context will need to be adapted to local conditions, but I agree that this paper captures what should be thinking about as we continue to expand, document, and evaluate the use of AI in work settings.
