Potential competing interests: No potential competing interests to declare.

This study has a lot of potential but requires minor revision. Several parts should be rewritten.

Table 2 has a lot of numbers and should be more precise. Columns and values are not visible and should be arranged better.

In the section Results, it is necessary to put units of measure throughout the entire text and not only in individual parts, for example, mg/ml or %.

In the section Discussion and Conclusion, in this context, the term chemicals should not be used; instead, 'secondary metabolites' should replace it throughout the text. Also, "Phytochemicals" is a better choice, but there are more precise terms in the context of plant metabolites.

The section conclusion is too general; there is no connection to the results, so it should be rewritten. There is a question of why the conclusion section appears twice.

Generally, this is a well-written paper worth publishing after minor revision.

All the best to the authors,
