

# Review of: "Climate Change and Sustainability: A Comparative Case Study"

A. K.A. Rathi

**Potential competing interests:** No potential competing interests to declare.

It is a good attempt to discuss the topical climate change and sustainability. It will be good to compare the approaches in the countries that are comparable, such as Sweden and some other European or Scandinavian country, India and China or Brazil. The "indepth abnalysis" creates high expectations. Thus, the use of "an overview" or "highlights" would have been better. There is a plenty of literature available on climate change and sustainability in 2010s and 2020s that could have been cited.

A good comparison necessitates comparing a given aspect for both. Thus, it would be good to compare the highlighted aspects such as Renewable Energy Transition, Urban Planning, Waste Management Practices, Environmental Governance, and Future challenges for both the countries in a similar proportion. Based on such a discussion, some conclusions and recommendations could be drawn, which benefit the policymakers and planners in both the countries.
