**Potential competing interests:** No potential competing interests to declare.

The methodological study with the aim of producing a Toys Suitability Index Instrument (Toy Index) based on the assessment of the suitability level of children's toys aged three to five years old.

The introduction justifies the importance of the study.

The methods are clear, with methodical rigor from the selection criteria of the panel of experts to the multivariate analysis using fuzzy logic.

The results present a Scale with clear and relevant items.

When discussing the results, it is important to highlight who can use the instrument: "In other words, this Toy Index instrument is not suitable to be used by the general public who do not have the expertise; however, it is more suitable to be used by experts in the field".

It wasn't clear if it is a limitation or just a recommendation.

The Conclusion responds to the objectives of the study.

Some references have more than 5 years of publication. However, they are pertinent to the subject of the study. Features up-to-date references as well.

I recommend acceptance of the manuscript.
