This case report presents an interesting and medically relevant case of methotrexate-induced lymphadenitis (MILA). The description is well-structured and provides a clear overview of the case. While the abstract is generally well-written, it could be further condensed by removing less essential details. The inclusion of a histological image of MILA is a valuable addition to the report and contributes to our understanding of this condition. It would be better if the author could explain briefly the histological feature on the basis of which the diagnosis was made. Overall, this case report is a valuable contribution to the medical literature and will be of interest to healthcare providers treating patients with methotrexate.
